Course Description

It is important to establish a system of care for better osteoporosis management and surgical outcomes for fragility fractures in the geriatric population. In this highly interactive course, the participant will become familiar with the latest techniques and concepts of co-managed care in treating fragility fractures and ortho-geriatric patients. Case-based sessions will provide tips and pearls in dealing with medical issues associated with geriatric fractures and effective surgical techniques and adjuncts to tackle osteoporotic fractures. The benefits of medical co-management will be explained. Multi-disciplinary interactive sessions will encourage active discussion of fundamental issues encountered when treating the elderly.

The international faculty consists of orthopedic surgeons, geriatric physicians, and anesthesiologists who have extensive experience in the treatment of the elderly. This course will enhance your ability to treat the fastest growing portion of our population with the most urgent medical needs. There will be specialized sessions for all participants as well as combined sessions with the orthopedic surgeons, anesthesiologists and physicians extenders to enhance and meet the needs of all disciplines.

Course Objectives

At the end of the course, participants should be able to:

- Surgically manage fragility fractures either with osteosynthesis or arthroplasty techniques
- Recognize and address comorbidities and polypharmacy during preoperative optimization through to postoperative follow-up
- Build a system of care appropriate to fragility fractures and discuss strategies for implementation of a co-managed geriatric fracture program
- Address secondary prevention such as, osteoporosis, malnutrition and falls
